The present invention provides peptides, therapeutic compositions, and methods for treatment of rheumatoid arthritis in mammals, specifically in humans. The peptides of the invention comprise fragments of type Is collagen which bind specifically with human major histocompatibility complex proteins known to be genetically linked to susceptibility to rheumatoid arthritis. The therapeutic compositions of the invention comprise the peptides, alone or in combination with other collagen peptides. AAW03105-107 are claimed peptides which can be used to treat rheumatoid arthritis by down-regulating the autoimmune response, esp. rendering T cells non-responsive to the rheumatoid arthritis-related autoantigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    MHC class II; major histocompatibility complex; autoimmune disease; inflammatory disease; binding; rheumatoid arthritis; antiinflammatory; antiarthritic; multiple sclerosis.
                                                                                                                                                                                                                                            New peptide fragments from human type II collagen - bind to specific major histocompatibility complex proteins and are useful, opt. with known collagen fragments, to treat rheumatoid arthritis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Length 13;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides peptides, therapeutic compositions, and methods for treatment of rheumatoid arthritis in mammals, specifically in humans. The peptides of the invention comprise fragments of type II collagen which bind specifically with human major histocompatibility complex proteins known to be genetically linked to susceptibility to rheumatoid arthritis. The therapeutic compositions of the invention comprise the peptides, alone or in combination with other collagen peptides. AMMO3105-107 are claimed peptides which can be used to treat rheumatoid arthritis by down-regulating the autoimmune response, esprendering I cells non-responsive to the rheumatoid arthritis-related.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New peptide fragments from human type II collagen - bind to specific major histocompatibility complex proteins and are useful, opt. with known collagen fragments, to treat rheumatoid arthritis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Collagen; type II; Bovine; Human; rheumatoid arthritis; epitope; human major histocompatibility complex; genetically linked.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          δy
                                                                                           The present invention describes synthetic peptides having an amino acid sequence comprising at least 3 residues selected from the group of amino acids consisting of aromatic acids, negatively charged amino acids, the synthetic positively charged amino acids, negatively charged amino acids, the synthetic peptides being at least 7 amino acid residues in length and capable of binding to a major histocompatibility complex (MHC) class II protein associated with an autoimmune disease. The synthetic peptides have anti-inflammatory and anti-arthitic activities. They are used to treat inflammatory and anti-arthitic activities. They are used to treat inflammatory and anti-arthitical activities. They are used to treat inflammatory and demyelinating activities. The peptides have respecific for particular MHC class II alleles. Purified, short and synthetic peptides should have fewer side effects than mixtures of random compliates; may include many repeats of the active sequence and/or contain amino acid analoques that improve stability (or other desired features). AAV8201 to AAV8201 to AAV82014 to AAV82014 or AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014 to AAV82014
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
             New synthetic peptide, useful for treating autoimmune disease, e.g. rheumatoid arthritis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Collagen; antigen; autoimmune disease; multiple sclerosis; autoimmune haemolytic anaemia; autoimmune cophoritis; autoimmune haemolytic anaemia; autoimmune cophoritis; contact sensitivity disease; diabetes mellitus; Graves disease; Guillain-Barre's syndrome; Hashimoto's disease; didlopathic myxedema; myasthenia gravis; psoriasis; pemphigus vulgaris; rheumatoid arthritis; systemic lupus erythematoid arthritis; antianaemic; antithyroid; antidiabetic; thyromimetic; antisonamatory; major histocompatibility complex; antifilammatory; therapy; major histocompatibility complex; MMC class II; human lymphocyte antigen; HLA-DR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

                                                                                                                                                                                                                                                                                                                                                                                          New terpolymers, copeptides and copolymer I which contain three amino acids randomly joined in a linear array where one is aromatic, one is aliphatic and the other is charged, used to treat autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents type II collagen peptide 261-273. The peptide was used in the design of copeptides (see AAR58956-88) that show a high affinity for MHC class II proteins associated with an autoimmune disease, especially HLA-DR1, HLA-DR2 or HLA-DR4, bind to antigen presenting cells, and inhibit T cell responses. The copeptides are used to treat multiple sclerosis, autoimmune thyroiditis, autoimmune uveoretinitis, chronic immune thrombocytopenic purpura, coolitis, contact sensitivity disease, diabetes mellitus, Graves disease, Guillain-Barre's syndrome, Hashimoto's disease, idiopathic myxedema, myasthenia gravis, psoriasis, pemphigus vulgaris, rheumatoid arthritis and systemic lupus erythematosus (all

The immunomodulatory peptide comprises a first peptide associated with autoimmune disease, allergy or asthma, or host-versus-graft rejection and which will bind to an antigen receptor on a set or subset of T cells, linked to a second immune modulating peptide which will cause a directed immune response by the set or subset of T cells to which the first peptide is attached. Alternatively, the second peptide will bind to a T cell receptor site on the surface of the T cell which will cause the set or subset of T cells to undergo anergy and apoptosis. The immunomodulatory peptides are useful for eliminating a set or subset of T cells involved in autoimmune response. They are useful for eliminating a set or subset of T cells involved in autoimmune response. They are useful for Novel immunomodulatory peptide construct useful for modulating an inappropriate immune response in an individual at risk for autoimmune disease, allergic reactions, asthma or host-graft or graft-host disease the treatment of autoimmune disease, allergic reactions, asthma or host-graft or graft-host rejections. The immunomodulatory peptides are also useful for interrupting an autoimmune disease associated pathway necessary to complete T cell activation. The present peptide is used to construct immunomodulatory peptides of the invention, and is representative of the first peptide. The specification describes an immunomodulatory peptide construct.  protein search, using sw model OM protein

January 31, 2002, 13:39:19 ; Search time 46.78 Seconds (without alignments) 10.973 Million cell updates/sec Run on:

SAVHDPGYEGRPEY 14 US-08-957-709-75 14 1 SAVHDPGYRCBDEV Perfect score: Sequence: OLIGO Gapop 60.0 , Gapext 60.0 Scoring table:

100059 seqs, 36664827 residues Searched:

0 Word size : Total number of hits satisfying chosen parameters:

Minimum DB seq length: 0 Maximum DB seq length: 200000000

Post-processing: Listing first 45 summaries

SwissProt_39:* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents a Herpes simplex virus type-2 (HSV-2) protein sequence of the invention. This sequence was isolated from a HSV-2 strain SB5 (deposited as ATCC VR-2546) DNA fragment designated Contig ID 15. Based on homology, this sequence is a major DNA binding protein. The proteins can be used for the treatment or prevention of disease, to
                            This is the uridine-binding motif of the dCTP deaminase of methanococcus jannaschii. Sequences are provided (see AAW72849-57) of the uridine-binding motifs of dCTPases and dCTP deaminases of pyrococcus furiosus (see AAW72847), Methanococcus jannaschii, con the uridine-binding motifs of dCTPases and dCTP deaminaschii, con the consensus (see AAW72848) is also provided. A claimed herpesvirus; a consensus (see AAW72848) is also provided. A claimed herpesvirus; a consensus (see AAW72848) is also provided. A claimed performing the reaction in the presence of one or more of the following: a polymerase enhancing factor (PEF), a dCTPase, a collowing: a polymerase enhancing factor (PEF), a dCTPase, a criminal that turns-over dCTP and a protein having one or more of sequences provided in AAW72848-57. A claimed protein having PEF activity comprises one or more of sequences given in AAW72848-57.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents a Herpes simplex virus type-2 (HSV-2) protein sequence of the invention. This sequence was isolated from a HSV-2 strain SBS (deposited as ATCC VR-2546) DNA fragment designated contig ID 12. The proteins can be used for the treatment or prevention of disease, to induce an immunological response in a mammal or to identify inhibitors, activators or novel antilvirals. Antagonists of the proteins can be used to inhibit a viral polypeptide. The DNA sequence or a vector containing it can also be used to induce an immunological response in a mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            superfamily (195F). 195F polyperides and polynucleotides encoding them can be used for the prevention and treatment of disorders involving aberrant protein expression or biological activity. Members of the immunoglobulin superfamily are involved in cell shape, cell migration, recognition, cell growth and replication, cell shape, cell migration, immunological responses, molecular transport, shape recognition, toxin neutralisation, regulation of gene transcription and cell death marking. The 195F polypeptides can be used for the treatment of immune deficiencies, autoimmune disorders include multiple sclerosis, rheumatoid arthritis, cancer and insulin dependent diabetes mellitus. They can also be used to regulate haematopoiesis, treat osteoporosis and periodontal diseases, promote wound healing, treat including lesions associated arthritis, treat nervous system disorders including lesions associated

The present sequence presents a human leukocyte and blood related protein, designated LBAP. LBAP polynucleotides and polypeptides are useful for treating or preventing a disorder associated with decreased expression or activity of LBAP including a cell proliferative disorder such as actinic keratosis, arteriosclerosis, atherosclerosis, bursitis, cirrhosis, hepatitis, mixed connective tissue disease (MCTD), cirrhosis, hepatitis, mixed connective tissue disease (MCTD), cirrhosis, hepatitis, mixed connective tissue disease (MCTD), cirrhosis, hepatitis, mixed connective tissue disease (MCTD), cancers in myelofibrosis, paroxysmal nocturnal hemoglobinuria, etc., cancers in actiona, teratocarcinoma and in particular cancers of the adrenal sarcoma, teratocarcinoma and in particular cancers of the adrenal and an autoimmune/inflammatory disease, adult respiratory distress syndrome, allergies, ankylosing spondylitis, andlicated immunodeficiency allergies, ankylosing spondylitis, anyloidosis, anemia, asthma, complications of cancer, haemodialysis, and extracorporeal circulation, viral, bacterial, fungal, parasitlo, protozoan, and helminthic infections,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; IgSF; immunoglobulin superfamily; immunostimulant; immunosuppressive; cytostatic; antitrheumatic; antiartimitic; nootropic; antiddabetic; osteopathic; vulnerary; antiniflammatory; neuroprotective; antidonvulsant; antimicrobial; gene therapy; immune disorder; autoinmune disorder; infection; haematopoiesis; osteoporosis; perlodontal disease; inflammation; nervous system disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Lu DAM, Baughn MR, Tang YT, Azimzai Y;

```
The present sequence is a novel member of the Immunoglobulin (Ig)

superfamily (IgSP). IgSP polypeptides and polynucleotides encoding

them can be used for the prevention and treatment of disorders involving

aberrant protein expression or biological activity. Members of the

immunoglobulin superfamily are involved in cell attachment, cell-cell

recognition, cell growth and replication, cell shape, cell migration,

immunological responses, molecular transport, shape recognition, toxin

neutralisation, regulation of gene transcription and cell death marking.

The IgSP polypeptides can be used for the treatment of immune

celficiencies, autoimmune disorders and disorders caused by viral or

tungal infections. Such disorders include multiple sclerosis, rheumatoid

arthritis, cancer and insulin dependent diabetes mellitus. They can also

be used to regulate haematopoiesis, treat inflammatory disorders such as

diseases, promote wound healing, treat inflammatory disorders such as

carthritis, treat nervous system disorders including lesions associated

with Alzheimer's disease and Huntingdon's chorea, and inhibit growth and

infection of agents such as bacteria, fungi, viruses and other parasites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Polynucleotide sequence encodes a novel member of the Immunoglobulin superfamily which can be used in treatment of immune deficiencies and disorders, promotion of wound healing and prevention of microbial infections -

The present sequence is a novel member of the Immunoglobulin (Ig) superfamily (IgSF). IgSF polypeptides and polynucleotides encoding them can be used for the prevention and treatment of disorders involving aberrant protein expression or biological activity. Members of the immunoglobulin superfamily are involved in cell attachment, cell-cell recognition, cell growth and replication, cell shape, cell migration, immunological responses, molecular transport, shape recognition, toxin neutralisation, regulation of gene transcription and cell death marking. The IgSF polypeptides can be used for the treatment of immune deficiencies, autoimmune disorders and disorders caused by viral or fungal infections. Such disorders include multiple sclerosis, rheumatoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    diseases, promote wound healing, treat inflammatory disorders such as arthritis, treat nervous system disorders including lesions associated with Alzheimer's disease and Huntingdon's chorea, and inhibit growth and infection of agents such as bacteria, fungi, viruses and other parasites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          arthritis, cancer and insulin dependent diabetes mellitus. They can also be used to regulate haematopoiesis, treat osteoporosis and periodontal
Polynucleotide sequence encodes a novel member of the Immunoglobulin superfamily which can be used in treatment of immune deficiencies and disorders, promotion of wound healing and prevention of microbial

This sequence represents a human immune system molecule (IMOL) encoded by the cDNA isolated as clone 2705028 from the Incyte PONSAZTO1 library. The human IMOLS (AAB1536-B1550) and their encoding polynucleotides (AAA95775-A95789), and compositions comprising them are useful for the diagnosis, treatment or prevention of immunological disorders, infections and cell proliferative disorders associated with decreased expression or activity of IMOL, such as immunological disorders and east to treat or prevent disorders associated with decreased expression or activity of IMOL, such as immunological disorders. (e.g. inflammation, actinic keratosis, AIDS, Addison's disease), haematopoietic cancer, infections caused by virus (e.g. adenovirus, parvovirus, coronavirus), bacteria (e.g. Staphylococcus, Streptococcus, Shigella), fungi (e.g. Aspergillus, Blastomyces), parasites (e.g. Bingella), fungi (e.g. Aspergillus, Blastomyces), parasites (e.g. actinic keratosis, arteriosolerosis, bursitis), and cancers (e.g. leukemia, melanoma, sarcoma). The peptides are also useful as immunogens for the development of antibodies that

These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a protein of the invention.
by expression of IMOL, or in assays to monitor patients being treated with IMOL or agonists, antagonists, or inhibitors of IMOL.

The present sequence is one of 32 novel human secreted polypeptides. The nucleic acid molecules and polypeptides may be used in the prevention, diagnosis and treatment of diseases such as immune disorders (e.g. diagnosis, systematic luque erythematosus and human immunor deficiency virus (HIV) infections), hyperproliferative disorders (e.g. cancers and Gaucher, Gaigase), cardiovascular diseases (e.g. Scimitar syndrome, Chaga's cardiomyopathy and coronary arteriosclerosis), anadyopentic disorders (e.g. corneal graft neovascularisation and diabetic retinopathy), neurological disorders neovascularisation and diabetic retinopathy), neurological disorders (e.g. Huntington's chorea, Alzheimer's diseases and parkinson's disease), infectious diseases and/or for promoting wound healing, regeneration and/or chemotaxis. The nucleic acid molecules may be used to produce the secreted polypeptides. They may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid candences in samples. The polypeptides may be used as antigens in the production of antibodies and in assays to identify modulators of their expression and activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Amino acids encoded by 3' portion of prugAS vector SacI-HindIII region.
                                                                                                                                                                                                                                                                                                                Two peptides (AAW15195 and AAW15196) are respectively encoded by a nucleotide sequence located upstream of the SacI site (see AAT65087), and by the SacI-HindIII region (see AAT65088), of vector prugAS. This vector can be used for expression of cellulose-binding domain NI (AAW15193) of Cellulomonas fimi endoglucanase C (CenC) in Escherichia coli. NI can be produced for use in claimed methods of phase separation for large-scale protein purification and cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                      Purifying a polypeptide containing a polysaccharide binding peptide - using a phase-forming oligosaccharide and separating the phases, useful for large scale purification of proteins and enrichment of

The invention relates to a novel two-phase partition system for affinity separation which comparises a phase-forming obligosaccharide polymer to which a polysaccharide binding peptide (PBP) binds, and a phase to which a polysaccharide binding peptide (PBP) binds, and a phase separation inducting agent. The system may be used for the separation and interest is expressed in the host cell as a fusion protein with a polysaccharide binding peptide, and the cell lustuces. The protein of polysaccharide binding peptide, and the cell lustuces in the protein of polysaccharide binding peptide, and the cell lustuces. The protein of comparing page of a solution with a low long strength, high pin or containing a classor of a solution with a low long strength, high pin or containing a classor protein by the use of chemical cleavage agents such as classor protein by the use of chemical cleavage agents such as classor protein by the use of chemical cleavage agents such as classor protein by the use of chemical cleavage agents such as classor protein by the use of chemical cleavage agents such as classor protein by the use of chemical cleavage agents such as classor classor by the fusion protein has been engineered such that the invention include a wide variety of medically and industrially continue and such be cleavaged from the PBP, which remains bound to the particular cell type; for example, a fusion protein comprising to a particular receptor can be useful for concentrating a lagrand of a particular receptor can be useful for concentrating a largand of a particular receptor can be useful for concentrating a component in a mixture, removing contaminants and for preparison of a vide state reagent for floations selective binding of PBP from the continuous purification. Selective binding of PBP from the continuous purification of selective binding of particular expense. Continuous suride polymer makes it suitable for prepare separate systems contaminants and continuous purification of selective binding of particular receptor of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The fusion protein SLF-CBD comprises the extracellular domain of murine steel factor (SLF) linked to the cellulose binding domain (CBD) of the cellulomonas fini exoglucanase Cex. The present sequence is a peptide ragment of prugAs expression vector. PrugAs can be used for high level expression of SLF-CBD fusion proteins in Escherichia coli. The present invention relates to the use of SLF-CBD as a component of a composition used for an annoing the rate of division and differentiation of growth factor chancing the rate of division and differentiation of growth factor a complex of viable cells, containing biologically active growth factor receptors and ligands of the receptors which are immobilised on a blocompatible solid phase via a polysaccharide binding domain i.e. SLF-CBD, (Which is diffused on the solid phase), so that cell surface localised growth factor receptor diffuses within the cell surface composition of the present invention may be used to enhance wound healing via a growth factor-CBD conjugate, which would stimulate local
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Composition for enhancing rate of division and differentiation of growth factor dependent cells, comprising a growth factor receptor complex and its immobilized ligand
                                                                                                                    SLF-CBD; murine; steel factor; pTugAS; cellulose binding domain; exoglucanase; Cex; cell division; differentiation; growth factor; wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                             Doheny JG, Haynes CA;

"Structural analysis of Arabidopsis thaliana chromosome 3. II.
Structural analysis of Arabidopsis thaliana chromosome 3. II.
Sequence features of the regions of 4,251,695 bp covered by ninety Pl,
TAC and BAC clones.":
DNA Res. 7.217-222(2000).
-!- CORCTOR: FAD (BY SIMILARITY).
-!- SIMILALITY: TO PYRIDINE NUCLEOTIDE-DISULPHIDE OXIDOREDUCTASES
CLASS.II.
01-JUN-2001 (TrEMBLrel. 17, Last annotation update)

CYTOSOLIC MONODEHYDROASCORBATE REDICTASE.

Arabidopsis thaliana (Mouse-ear cress).

EURATYOCE, VITIAIPHATEA: Streptophyta: Embryophyta; Tracheophyta;

Spermatophyta: Magnoliophyta; eudicotyledons; core eudicots; Rosidae;

eurosids II; Brassicales; Brassicaceae; Arabidopsis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ś

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 2, App

5248606-47
Patent No. 5248606
Patent No. 5248606
Patent No. 5248606
TITLE OF INVENTION: DNA ENCODING INACTIVE PRECURSOR AND ACTIVE FORMS OF MAIZE RIBOSOME INACTIVATIN
NUMBER NO. SOUTHORES: 49
CURRENT APPLICATION DATA:
PAPPLICATION NUMBER: US/07/535,636
FILING DATE: 11-JUN-1990
SEQ ID NO:47:
                                                                    APPLICANT: Freeman Jr., Robert M.
APPLICANT: Plutzky, Jorge
APPLICANT: Neel, Benjamin G.
APPLICANT: Rosenberg, Robert D.
TITLE OF INVENTION: IDENTIFICATION OF NOVEL TYROSINE
TITLE OF INVENTION: PHOSPHATASES HAVING SH2 DOMAINS
                                                                                                                                                                                                              NUMBER OF SEQUENCES: 54
CORRESPONDENCE ADDRESS:
ADDRESSEE: Hamilton, Brook, Smith & Reynolds, P.C.
STREET: Two Militia Drive
CITY: Lexington
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CURRENT APPLICATION DATA:
